## Stacking

$$\mu = \lim_{N \rightarrow \infty} \left[ \frac{1}{N} \sum_{i=1}^N x_i \right]$$

$$\sigma^2 = \lim_{N \rightarrow \infty} \left[ \frac{1}{N} \sum_{i=1}^N (x_i - \mu)^2 \right]$$

$$\sigma_{\mu}^2 = \sigma^2 / N$$

• For stacking, the variance of the mean is  $1/N$  times the variance of the individual measurements. Hence making  $N$  measurements reduces the standard deviation of the mean by  $1/\sqrt{N}$ .

• This is the basic idea behind stacking, averaging multiple measurements of some quantity yields an estimate that a smaller uncertainty than the individual measurements.

NMO: a reflection whose variation in travel time with offset is the normal moveout

$$T(x) - t_0 = (x^2/\bar{V}^2 + t_0^2)^{1/2}$$

A hyperbolic time shift lines up reflections with hyperbolic travel time curves (analogous to the reduced travel time plot).

Figure 3.3-15: Diagram of the normal moveout correction.

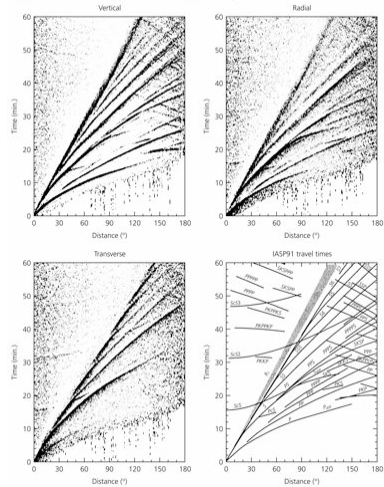

Figure 2.7-4: Six-hour stacked IDA record section.

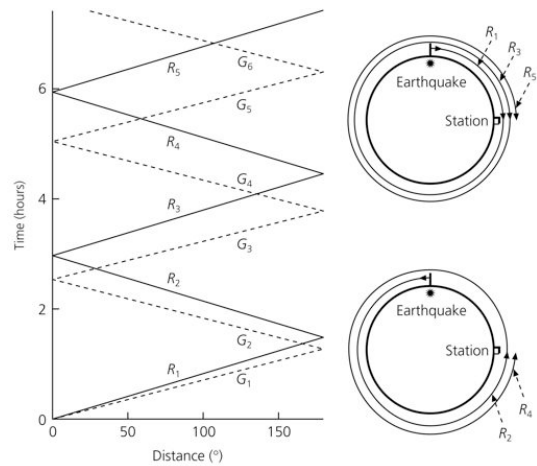

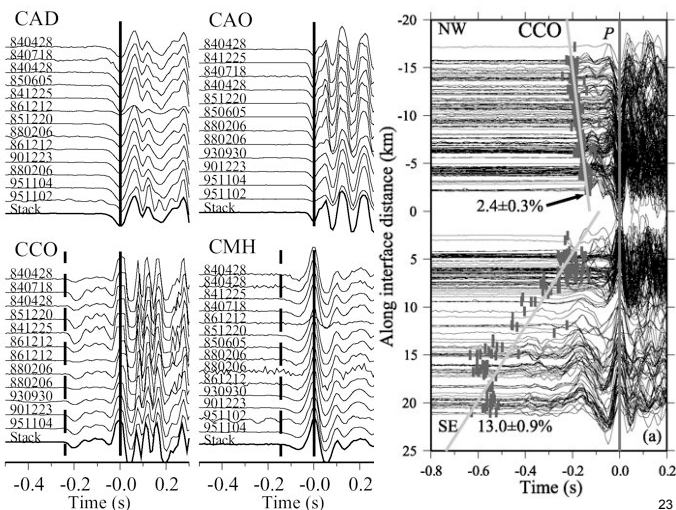

Figure 2.7-4: Six-hour stacked IDA record section.

Fault zone head waves refract along bi-material interface and are recorded by stations on the slow side of the faults.

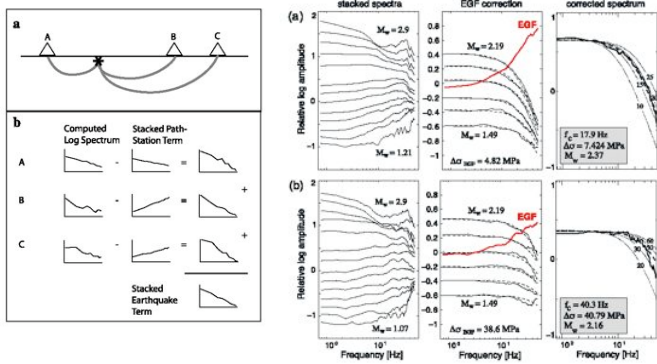

Zhao and Peng (GRL, 2008)

## Stacking to obtain source properties

- Stacking is used to obtain reliable source properties (e.g., source time functions, source spectra, etc) under the following assumption:
  - Earthquake source is a common term for seismograms recorded at by multiple stations.
  - Hence stacking will help to enhance the source terms while suppressing other near-station effects.

## Stacking for reliable earthquake spectra

## Example of stacking using SAC

- The easiest way is to use the command “addf” in SAC:
  - SAC> r wf1.sac
  - SAC> addf wf2.sac
  - SAC> ...
  - SAC> div 10
  - SAC> w stack.sac
  - # Note: the data has to be the same length
- Another way is to use my own command: sacStack

2/20/11

zpeng Seismology II

31

## sacStack

- usage: sacStack [-E(t(0-9,-5(b),-3(o),-2(a))|vel)] [-N] [-Q] [-Rt1/t2] [-Sbaz/p] -Ooutput\_file (sac\_traces in the argument list or from the stdin)
  - -E: align with a time mark or with an apparent velocity (b)
  - -N: normalize (off)
  - -Q: square traces before stacking (off)
  - -R: time window t1 and t2
  - -S: set baz and user0 (p) in head
- Example:
  - sacStack -Et-3 -R0/20 -Ostack.sac wf\*.sac
